DETAILED ACTION

Allowable Subject Matter

1. Claims 1-5 are allowed.

The following is an examiner's statement of reasons for allowance:

Independent claim 1 establishes transmitting a START value from the mobile unit to the UTRAN; the UTRAN sending the control command to the mobile unit, and setting the x most significant bits of the second integrity count value equal to the START value; and setting the x most significant bits of the first integrity count value of the mobile unit equal to the START value last transmitted to the UTRAN in response to receiving the control command for verifying a transmission integrity between the mobile unit and the UTRAN. This limitation is neither disclosed nor suggested in the prior art of record or newly cited references of Valen et al (U.S. Pub. 2002/0044552 A1), Wen (U.S. Patent 5457737), and Vanderveen (U.S. Pub. 2002/0197979 A1).

Valen et al discloses an integrity key (Par.5:8, secret key); at least a mobile unit comprising a first integrity count value (Par.6:3-4, message authentication value of transmitting party), the first integrity count value consisting of a predetermined bit length (Par.5:1-2, message authentication codes are short string of bits); at least a universal terrestrial radio access network (Fig.1:4). (UTRAN) comprising a second integrity count value (Par.6:7-8, message authentication value of receiving party), the second integrity count value consisting of the predetermined bit length (Par.5:1-2, message

authentication codes are short string of bits), the UTRAN coupled to the mobile unit for transmitting a control command to the mobile unit (Par.2;6-9), the control command used for starting an integrity protection process for the radio bearer (Par.1), the integrity protection process using the integrity key and the first and second integrity count values for verifying a transmission integrity between the mobile unit and the UTRAN (Par.6). However there is no mention of transmitting a START value from the mobile unit to the UTRAN; the UTRAN sending the control command to the mobile unit, and setting the x most significant bits of the second integrity count value equal to the START value; and setting the x most significant bits of the first integrity count value of the mobile unit equal to the START value last transmitted to the UTRAN in response to receiving the control command.

Wen and Vanderveen both discloses of a method to verify the identity of a mobile phone user however, there is no mention of transmitting a START value from the mobile unit to the UTRAN; the UTRAN sending the control command to the mobile unit, and setting the x most significant bits of the second integrity count value equal to the START value; and setting the x most significant bits of the first integrity count value of the mobile unit equal to the START value last transmitted to the UTRAN in response to receiving the control command.

Claims 2-5, are allowed as being dependent on the independent claim 1.
